

Project name:	Implementation of Real-Time Cycle Time Service & Historical Analytics	Project Team:	José Antonio González Vázquez (TIP/MFD), Aaron Francisco Gonzalez Mejia (TIP/MFD)		Project Sponsor:	TIP/MFD						
Project Owner:	José Antonio González Vázquez (TIP/MFD)				CIP Coach:	Gonzalez Mejia Aaron Francisco (TIP/MFD)						
					Date:	8/20/2026						
Background	Deviations from target not immediately visible Line by line analysis CT calculation limited Slower decision making				Approach	What?		Why?		How?		
						1 Improve calculation of CT across all the lines		Save time to takes calculate CT		-Automatized process with Python -applying stadistics rules		
Initial State		Current CT calculation limited by only 2 hours There's no historical CT data. Calculation approach is not suitable for data inflation scenarios				Results	✓ Service feeds multiple dashboards across production lines		Analysis Time Reduction: Cut manual CT analysis time from ~15 - 20 min/line to real-time (<1 min)			
							✓ Data used for morning Gembas and quick line status checks					
Target Condition		1 Improve the calculation of CT with an automated process 2 Centralize the information of CT of all lines in a dashboard 3 Support faster identification of issues and desicion making				Metrics	KPI Monitoring				95% reduction in analysis time	
							15 min / line daily for manual data extraction and cleaning					
						Next Steps	Implemets this solution to system SMC and across all the plant
